# Blockchain (BlCh)

**DS1 part 2**

Thomas Bocek

30.09.2021

# Lecture 4

# Load balancing

- What is load balancing
  - Distribution of workloads across multiple computing resources
    - Workloads (requests)
    - Computing resources (machines)
  - Distributes client requests or network load efficiently across multiple servers
    - E.g., service get popular, high load on service
    - horizontal scaling
- Why load balancing
  - Ensures high availability and reliability by sending requests only to servers that are online
  - Provides the flexibility to add or subtract servers as demand dictates

# Software-based load balancing

- Layer 7: HTTP(S), layer 7: DNS
- DNS Load balancing
  - Round-robin DNS, very easy to setup, static, caching with no fast changes
  - **Split horizon DNS** - different DNS information, depending on source of the DNS request
    - Your ISP, you if you do recursive DNS
    - But 1.1.1.1, 4.4.4.4, 8.8.8.8
  - Anycast (you need an **AS** for that, **difficult and time consuming**) – return the IP with lowest latency, e.g., **anycast as a service**, **Global Accelerator**
- Reduced Downtime, Scalable, Redundancy
  - Client can decide what to do
  - **Negative caching impact!**
  - Used in bitcoin: **dig dnsseed.emzy.de**

```

```

# CORS

- **CORS** = Cross-Origin Resource Sharing
  - For security reasons, browsers restrict cross-origin HTTP requests initiated from scripts (among others)
  - Mechanism to instruct browsers that runs a resource from origin A to run resources from origin B
- Solution
  1. Use reverse proxy with builtin webserver, e.g., nginx, or user reverse proxy with external webserver.
    - The client only sees the same origin for the API and the frontend assets
  1. Access-Control-Allow-Origin: <https://foo.example>
    - For dev: Access-Control-Allow-Origin: \*

- Reverse proxy

# Lecture 5

# Authentication

- Authentication
  - Single-factor authentication
    - E.g. password
  - Multi-factor authentication / 2FA
    - E.g. password and software token, SMS (15.03.2021)
- Password rules
- Don't use:
  - The name of a pet, child, family member, or significant other
  - Anniversary dates and birthdays
  - Birthplace
  - Name of a favorite holiday
  - Something related to a favorite sports team
  - The word "password"
- Don't reuse passwords, use password managers

- Don't enter passwords on unencrypted sites
- Password length:  
password cracking with 5000\$ in 2018 with hashcat
  - Hashtype: WPA/WPA2: 1190.5 kH/s
- Combinations depend on PW complexity

Pw length	Combinations	Time
6	11m	9s
7	656m	9m
8	38b	8h
9	$7 * 10^{15}$	186y
10	$4 * 10^{17}$	11ky
11	$2 * 10^{19}$	665ky
12	$1 * 10^{21}$	38my

# Authentication

- Session-based authentication (stateful)
  - Sticky session

- E.g., spring-boot
  - Simple login app
  - JSESSIONID, Session information, that user was successfully authenticated: **memory**

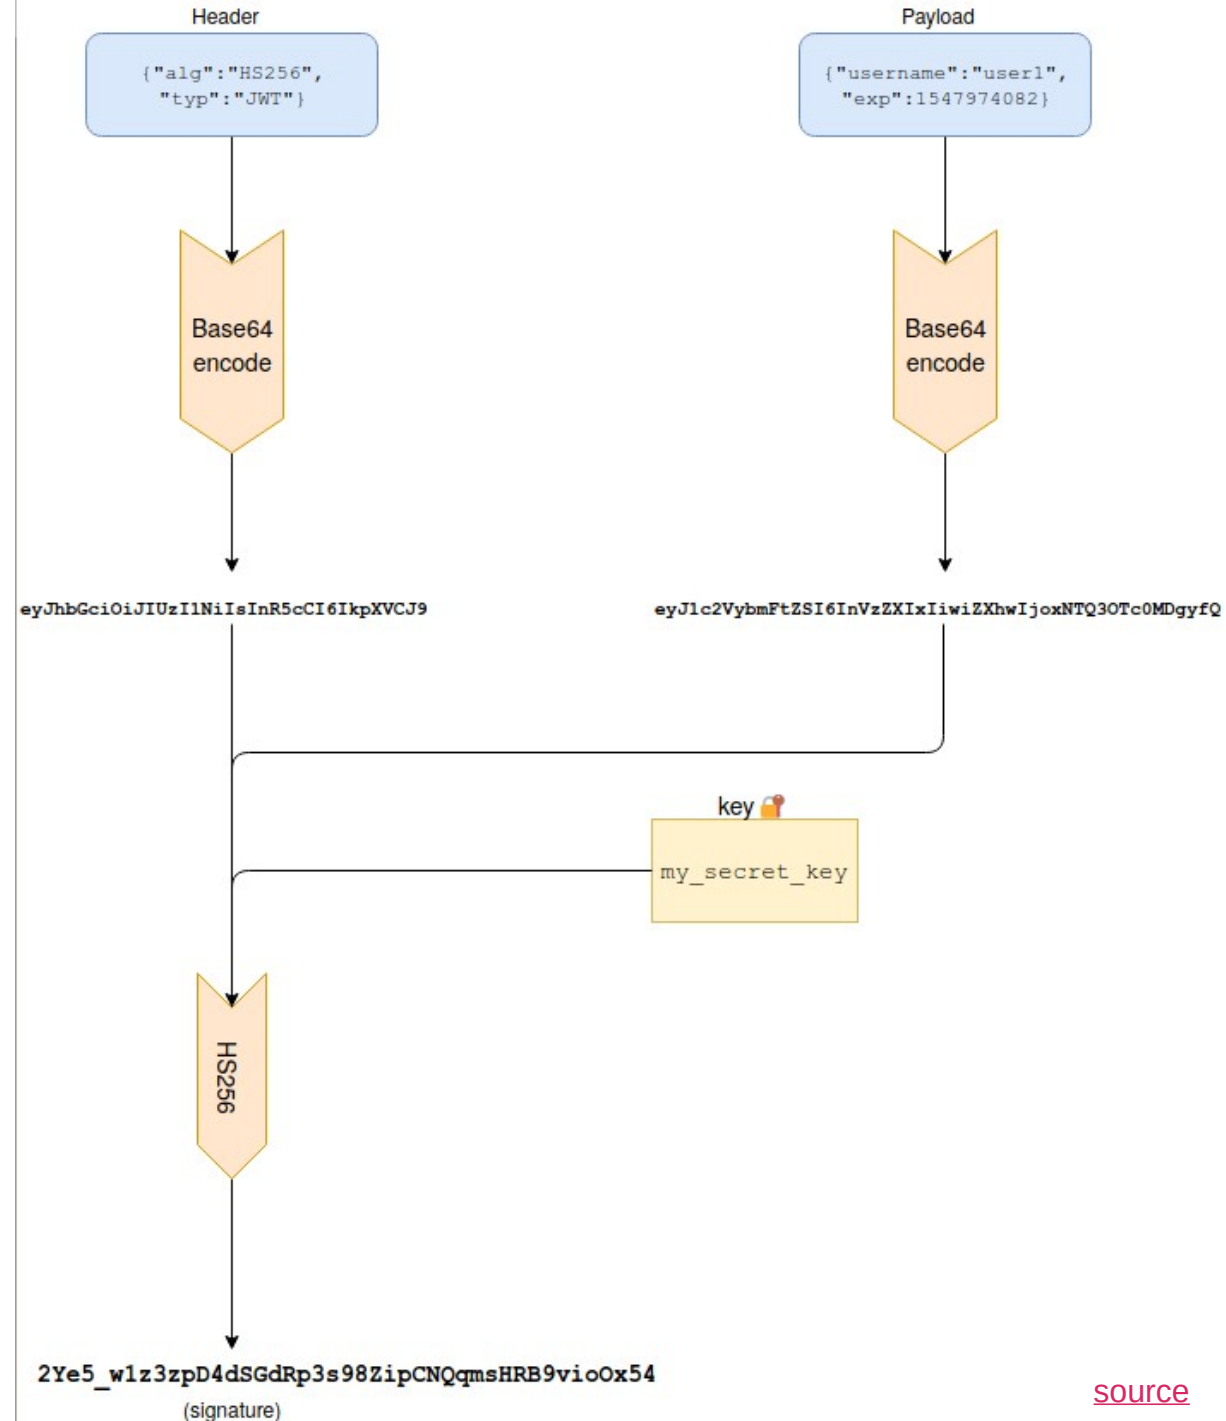

- org.apache.catalina.session.StandardManager based on ConcurrentHashMap
- JSON Web Token (**JWT**) (stateless)

- JSON-based access tokens (**jwt.io**)
  - All server instances know a secret token / public key
  - When user logs in, server send back token
  - Client sends: Authorization: Bearer <token>
  - `const user_token = base64urlEncoding(header) + '.' + base64urlEncoding(payload) + '.' + base64urlEncoding(signature)`

# Authentication

- JSON-based access tokens
  - Header: {"alg": "HS256"}
  - Payload: {"sub": "tom", "role": "admin", "exp": 1422779638}
- Signature (simple): keyed-hash message
  - $\sim \text{hash}(\text{base64}(\text{header}) + \text{base64}(\text{payload}) + \text{secret token})$
- Client can store user\_token in
  - `localStorage.setItem("token", userToken);`
- Example in golang with **JWT**
  - Tutorial: [here](#) and [here](#)
- **OAuth** - protocol for authorization 3rd party integration
  - Grant access on other websites without giving them the passwords

# Access Token / Refresh Token

- Access Token only short lifetime, e.g., 10min.
    - If public key / secret is known, the content in the token can be trusted, e.g., in the service
    - Can have userId, role, etc.
      - No need to query DB for those information, e.g.:
- ```
type TokenClaims struct {  
    MailFrom string `json:"mail_from,omitempty"`  
    MailTo    string `json:"mail_to,omitempty"`  
    jwt.Claims  
}
```
- Refresh Token longer lifetime, e.g., 6 month
    - A refresh token is used to get a new access token
    - IAM / Auth server creates access tokens
  - Only access token, with long lifetime
    - If a user credential is revoked – how to inform every service?
  - Only refresh token
    - Tightly coupled Service/Auth, every request to Service, Auth needs to be involved for every access
  - Access + Refresh token
    - If a user credential is revoked, user has max. 10min more to access service
    - Auth only involved if access token is expired
  - Authorization Code Flow with Proof Key for Code Exchange (PKCE)

# Lecture 6

# Protocols

- Protocols, lecture 2: layer 4
  - TCP, UDP, (QUIC)
- Designing custom protocols (e.g. Kafka)
  - Needs more time to develop / test
  - + Can be more efficient (space/performance)
- Protocol generators (binary): Thrift / Avro / Protocol Buffers / (ASN1)
  - + IDL (interface description language) generates code
  - + Standard
  - Has more overhead
- e.g, Avro IDL - higher-level language for authoring Avro schemata → generates Avro schema

```
//Avro IDL
@namespace("ch.hsr.dsl")

protocol MyProtocol{
  record AMessage {
    string request;
    int code;
  }
  record BMessage {
    string reply;
  }

  BMessage GetMessage(AMessage msg);
}
```

# JSON example

- JSON + REST
  - Human-readable text to transmit data
  - Often used for web apps
- 187 bytes

```
func main() {
    fmt.Println("Connecting...")
    req, _ := http.NewRequest("POST",
        "http://localhost:7000",
        strings.NewReader(`{"code": 5,"message": "Anybody
there?"}`))
    req.Header.Set("Content-Type", "application/json")
    client := &http.Client{}
    resp, err := client.Do(req)
    if err != nil {
        panic(err)
    }
    defer resp.Body.Close()
    fmt.Printf("wrote request")
}
```

- Parsing overhead, JSON slower than binary protocol - **benchmarks**

```
[
    {
        "id": "bitcoin",
        "name": "Bitcoin",
        "symbol": "BTC",
        "rank": "1",
        "price_usd": "9324.08",
        "price_btc": "1.0",
        "24h_volume_usd": "9039300000.0",
        "market_cap_usd": "158560288125",
        "available_supply": "17005462.0",
        "total_supply": "17005462.0",
        "max_supply": "21000000.0",
        "percent_change_1h": "0.46",
        "percent_change_24h": "-0.27",
        "percent_change_7d": "4.5",
        "last_updated": "1525011874"
    }, ...
]
```

# Application Protocol: HTTP

- HTTP (**HyperText Transfer Protocol**): foundation of data communication for www
- Started in 1989 by Tim Berners-Lee
  - HTTP/1.1 published in 1997
  - HTTP/2 published in 2015
    - More efficient, header compression, multiplexing
  - HTTP/3 wip
- Request / response (resource)
- HTTP resources identified by URL
  - [https://dsl.hsr.ch/design/hsr\\_logo.svg](https://dsl.hsr.ch/design/hsr_logo.svg)

- Text-based protocol

```
openssl s_client -connect dsl.hsr.ch:443
... TLS handshake ...
GET /
```

## Request Headers (359 B)

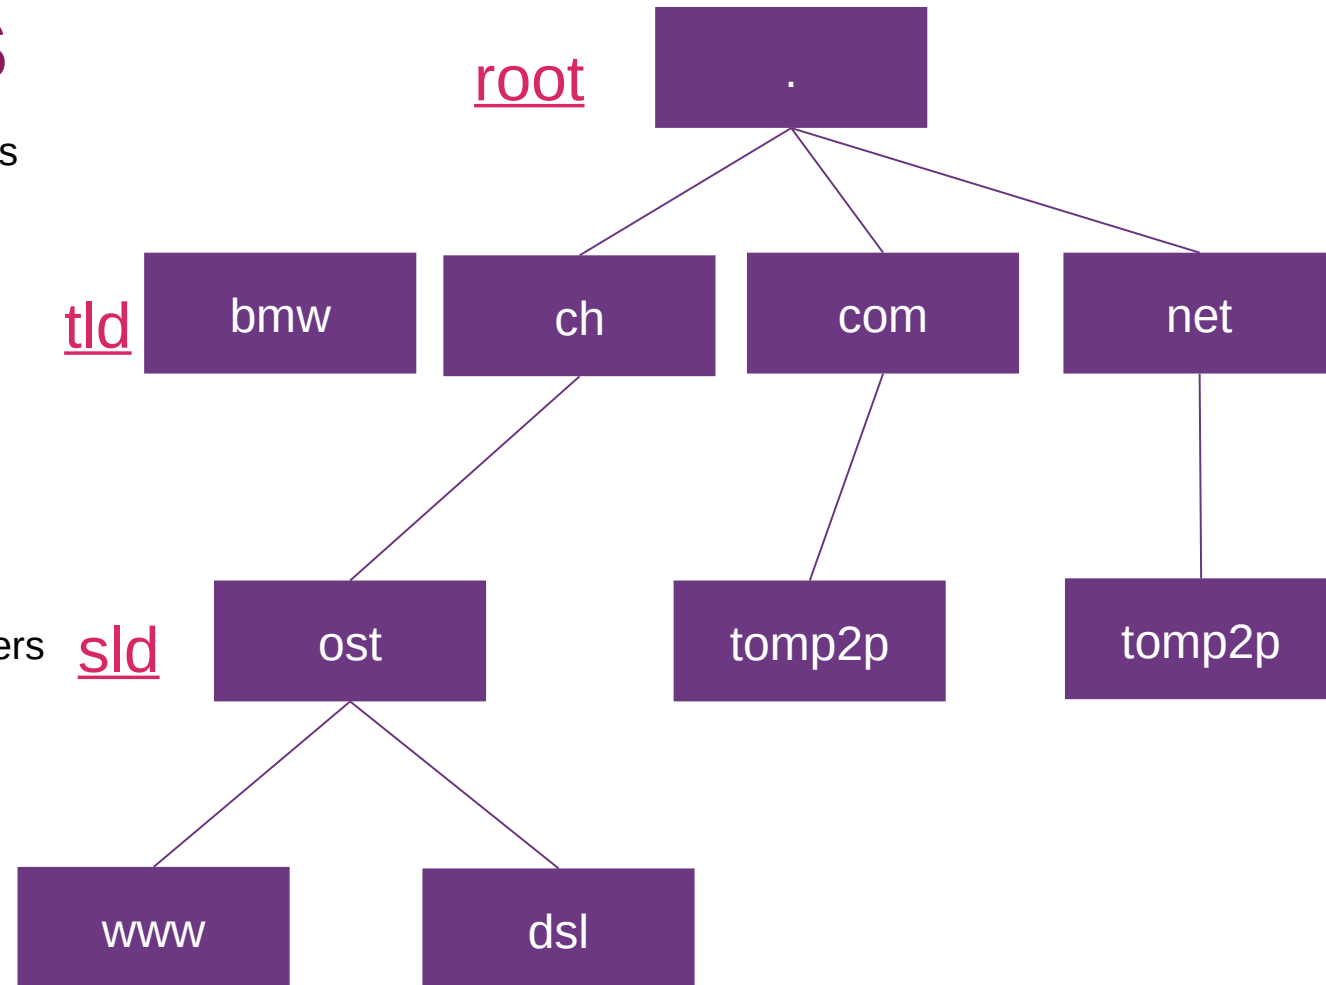

```
Host: dsl.hsr.ch
User-Agent: Mozilla/5.0 (X11; Linux x86_64; rv:73.0) Gecko/20100101 Firefox/73.0
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/webp,*/*;q=0.8
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate, br
DNT: 1
Connection: keep-alive
Upgrade-Insecure-Requests: 1
Cache-Control: max-age=0
TE: Trailers
```

Scheme    User info    Host    Port    Path    Query    Fragment

  
<http://tbocek:password@dsl.hsr.ch:443/lect/fs21?id=1234&lang=de#topj>

# Application Protocol: DNS

- Translates human readable domain names to IP addresses “phonebook of the Internet”
  - Delegate authority over sub-domains to other name servers
- **Lots of new TLD**  
: .zuerich, .bmw, .americanexpress, .youtube, .39 (application fee 185k USD)
  - No special characters: ASCII (no UTF)
  - **Punycode**: bücher.tld → xn--bcher-kva.tld
- Hierarchical and decentralized naming system for computers **sld**
  - E.g., dsl.hsr.ch
  - Uses UDP, port 53
  - Designed in 1983: unencrypted, unsigned
- Before DNS: exchange of hosts.txt
  - Does not scale

# The DNS war

## DoH

- provides confidentiality of lookups in transit
- Uses standard HTTP/2, on the standard port (443)
- Cannot distinguish between traffic/DNS
- Trivially deployed, DNS responses are served like simple web pages
- Performance: TCP+TLS handshake → 2/3 RTT
- But: Cloudflare is close to you
- Difficult upgrade path for clients: per-application installation
- Browsers can perform DNS queries using Javascript

## DoT

- provides confidentiality of lookups in transit
- DNS over TLS, separate port (853)
- Can be blocked
- Widely supported by serving software (Bind, PowerDNS, Unbound) and public resolvers (Cloudflare, Quad9, Google)
- Performance: TCP+TLS handshake → 2/3 RTT
- But: ISP is close to you
- Easy upgrade path for clients: clients can test if the configured resolver supports DoT on port 853, fall back to DoU53 otherwise)

# Lecture 9

# Introduction

- Bitcoin is an experimental digital currency
  - Bitcoin is fully decentralized (no central entity)
  - Smallest unit: 0.00000001 BTC (1 satoshi)
- Key characteristics
  - **Maximum** of ~21 million BTC
  - Every transaction broadcast to all peers
    - Every peers knows all transactions (~366 GByte )
  - 1st Bitcoin issued on January 3, 2009
- The initiator is unknown so far

### About Babbage

In this blog, our correspondents report on the interests between science, technology, culture and policy. The blog takes its name from Charles Babbage, a Victorian mathematician and engineer who designed a mechanical computer.

# Bitcoin's Market Capitalization in USD

- Bitcoin boom, started in 2013 – current price

# Bitcoin's Price USD 2021

# Bitcoin's Price USD 2021

- What happened on the 24.9.2021?
- **24.9.2021**: China declared that cryptocurrency transactions and mining are illegal

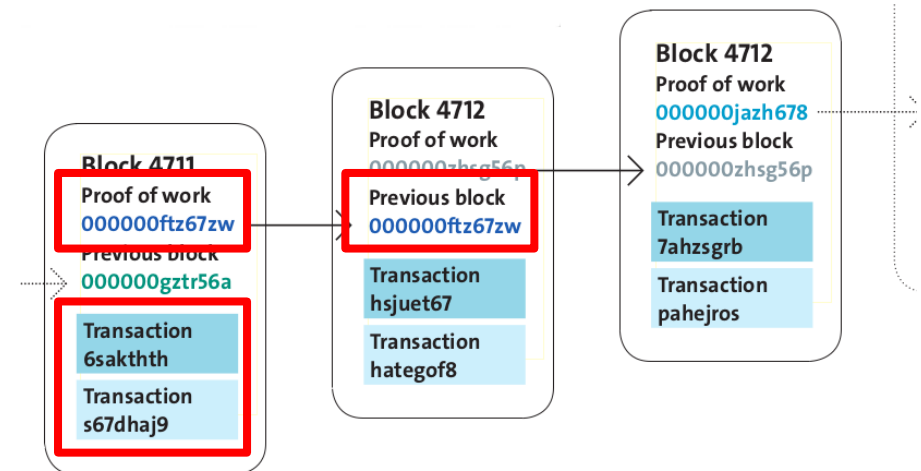

# Timeline of China vs. Crypto [source]

- Fall 2013
  - China bans banks from handling **bitcoin transactions**, calling it a “virtual good” and not legal tender.
  - BTC China, the country’s largest bitcoin exchange, **stops taking deposits** in yuan under pressure from payment processors and the government.
- Fall / Winter 2017
  - Amid a crypto boom, China says it is investigating **market manipulation** and money laundering through bitcoin.
  - China bans **initial coin offerings** (ICOs).
  - **Crypto exchanges** are banned in China. Citizens largely get around the ban by using offshore exchanges and peer-to-peer trading.
- Fall 2019
  - China considers eliminating **crypto mining** but eventually declines to act.
- Spring 2021
  - China cracks down on **crypto mining**, as mining activities start to threaten the country’s **environmental goals**.
  - The government **bans financial institutions** and payment companies from providing crypto-related services.

# Blockchain (e.g., Bitcoin)

- Alice sends Bob 1 BTC
  - Transactions are collected in blocks
  - New block created approximately every 10 min
- A block has a pointer to previous block
- Blocks contain solved crypto puzzles
  - Creation of blocks is called mining (**reward**)
  - In the form of partial **hash collisions** (SHA256)

# Cryptographic Hash Function

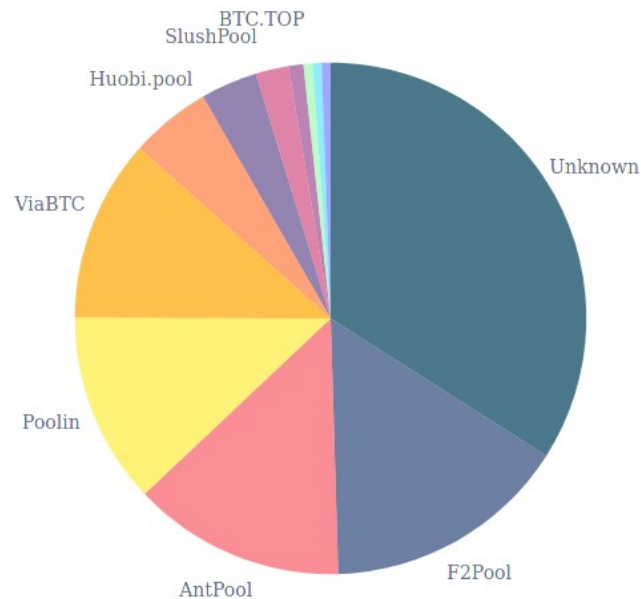

- One-way function
  - Easy to calculate hash (949bd2f7a173661b1b87efff86b2b20b8c5d07c067698c58ad98887396facb3) if “Hello OST” is known
  - Difficult to calculate “Hello OST”, if only 949bd2f7a173661b1b87efff86b2b20b8c5d07c067698c58ad98887396facb3 is known
  - **Example**

## SHA256 Hash

|       |                                                                                              |
|-------|----------------------------------------------------------------------------------------------|
| Data: | <input type="text" value="Hello OST"/>                                                       |
| Hash: | <input type="text" value="949bd2f7a173661b1b87efff86b2b20b8c5d07c067698c58ad98887396facb3"/> |

# Mining

- Miners specialized, AMD GPUs, ASIC (application-specific integrated circuit) [1][2][3]
- Mining = finding solution to crypto puzzle

<http://blockchain.info/pools>

<https://bitcointalk.org/index.php?topic=7216.560>

# Mining

- Mining farms: [1], [2], [3], [4], [5], [6], [7]

<http://www.openmobilefree.net/?p=1308>

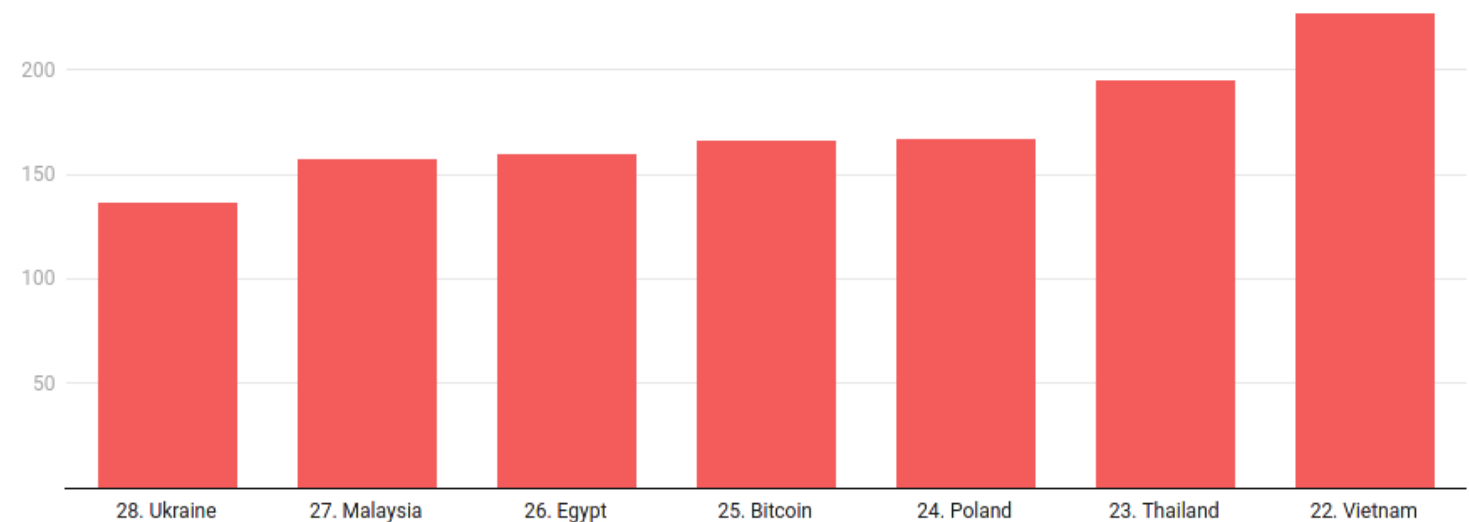

Source: <https://www.datacenterdynamics.com/en/news/knc-miner-to-build-second-facility-in-the-node-pole/>

# Electricity

- High energy consumption [[source](#)], Switzerland ~60TWh
- Visualized
  - Ethereum? ~75TWh

Energy Consumption by Country (Annualized TWh)

Source: [BitcoinEnergyConsumption.com](#) • [Get the data](#) • [Download image](#) • Created with [Datawrapper](#)

# Ethereum

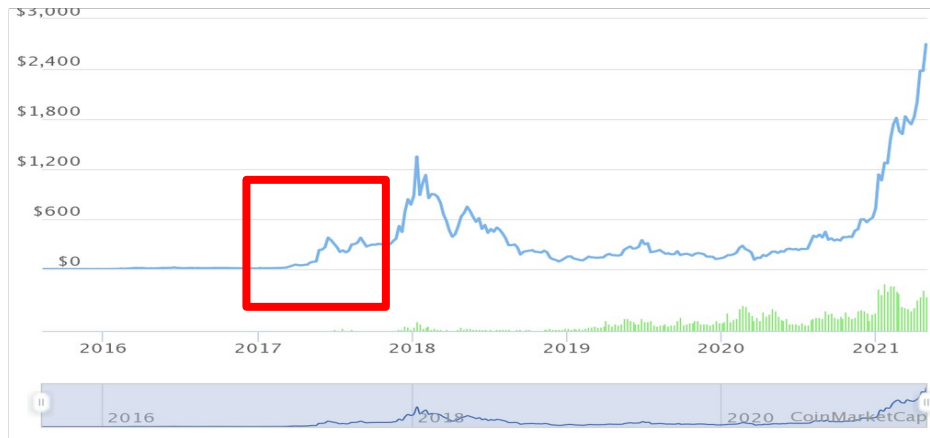

- Ethereum (1 ETH ~3000\$)
- White paper released in December 2013
- Protocols designed from scratch (not a Bitcoin clone)
- Ethereum foundation located in Zug (initiator known) - non-profit foundation
- Mining reward ~2 ETH (“always”, unlike Bitcoin)
- Blockchain with smart contracts (loops, arithemits, etc. )
  - Smart contract programming

Vitalik Buterin

# Ethereum in Numbers

- 2nd in market cap ~ 352b USD
- Block every ~14s
- Crypto puzzle memory hard (difficult for ASICs)
  - Avoid miner centralization
  - ~75TWh

# Ethereum 2.0

- Current problem: crypto puzzles need a lot of energy
  - ETH 2.0 – change from proof-of-work to proof-of-stake (research started 2013, still ongoing)
  - Tezos has proof-of-stake ~60 MWh
- Why not use a energy friendly blockchain?
  - Cardano (13.9.2021) - **Cardano launches** smart contracts after successful hard fork
  - Binance Coin (not considered decentralized)
  - Ethereum has (in my opinion) the best developer tooling and ecosystem
  - Bitcoin? well...
- The future (my opinion): energy friendly blockchains with e.g., proof-of-stake or other alternatives)

Estimated Annual Energy Consumption (measured in TWh)

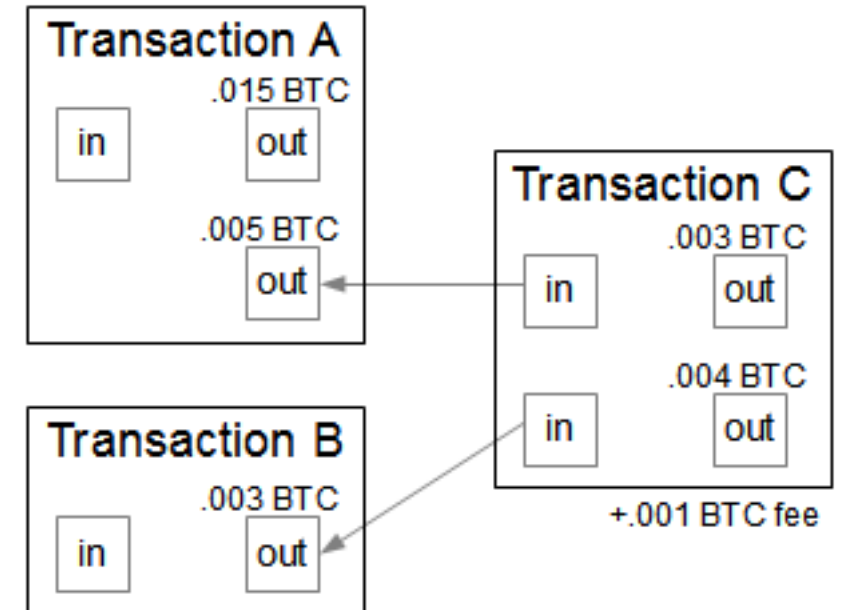

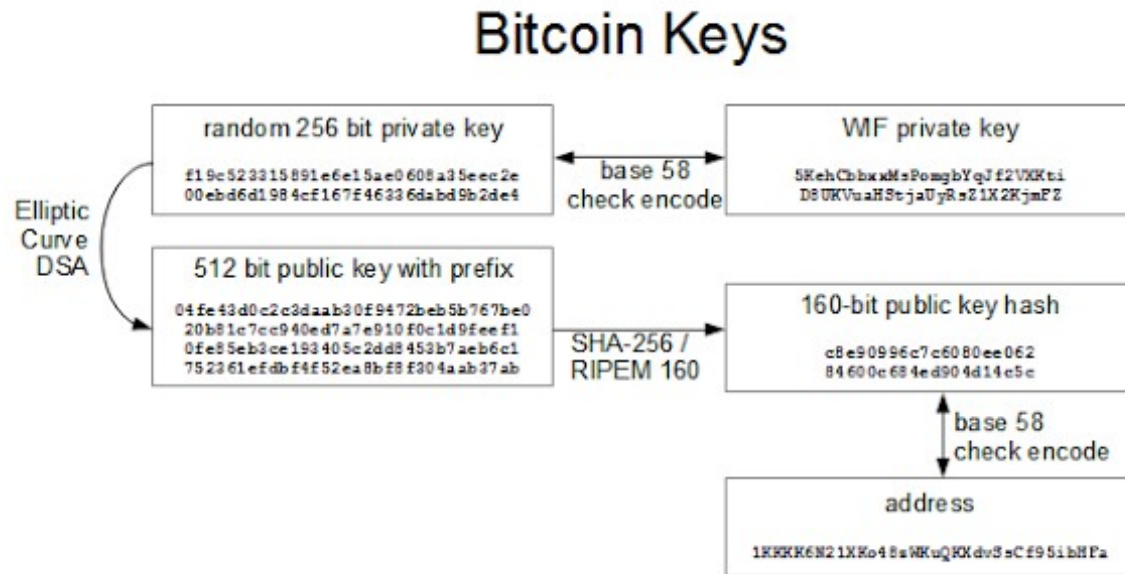

# Lecture 10

# Bitcoin in Detail

- Good information: <http://www.righto.com/2014/02/bitcoins-hard-way-using-raw-bitcoin.html>

# 51% Attack

- “If a majority of CPU power is controlled by honest nodes, the honest chain will grow the fastest and outpace any competing chains.”
  - <https://bitcoin.org/bitcoin.pdf>
- PoW: majority of hashing power, PoS: majority of coins
- How expensive is a 51% attack?
  - Buy an attack?
- Double spend, or rollback transactions
  - X is an exchange
  - Mine secretly, Y is your address
  - X arrived – payout (1 block conf.)
  - You mine faster, broadcast secret chain
  - Tx F → X: 15 never happened, goes to Y
- 04.08.2021: Bitcoin SV Faces a 51% Attack [\[link\]](#)
